

Colorado Department of Health

Review and Comment

**Historical Information Summary and Preliminary Health Risk
Assessment - Operable Unit 3, Sites 200, 201, and 202
Draft Final, June, 1991**

=====

- 1) Appendix B - Table B.1: There are still several errors on this table. Using the equations listed in the text for the calculation of the table values, the Division was unable to reproduce several of the values that appear on the table. For instance, in the seventh column (Air), the first value and sixth value should be $2.0E-02$ and the third value should be $2.1E-02$. In the ninth column, the second value should be $6.1E-07$.
- 2) Appendix B - Section 4.0: The Division still believes that a copy of the pertinent pages of HEAST (Health Effects Assessment Summary Tables) would benefit the presentation of this section. If DOE and EG&G do not want to copy these pages into the document, at least review the format of HEAST and tell the reader how to use the HEAST tables.
- 3) Appendix C - Table C.2: The values presented in the second (Added Risk) column and the fifth (Increased Risk for Pu) must have some supporting and/or background explanation. This could be accomplished by additional text or footnotes to the table. The values for "Added Risk" on the table do not agree with those presented in the text, and the method for calculating the "Increased Risk" is never presented.
